

# Algorithm Analysis

# Agenda

- **What is an Algorithm?**
- **Difference between a Program and an Algorithm**
- **Multiple Ways of Solving a Problem**
- **Benefits of Evaluating an Algorithm**
- **How can we evaluate programs?**
  - **Approach 1 (Simulation: Timing)**
  - **Approach 2 (Modeling: Counting)**
  - **Approach 3 (Asymptotic Behavior: Order of Growth)**

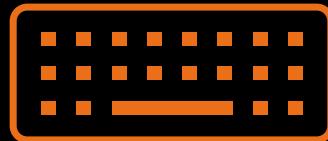

# Algorithm

# Algorithm

An algorithm is a step-by-step procedure for solving a problem.

# Algorithm

An algorithm is a step-by-step procedure for solving a problem.

Input

Output

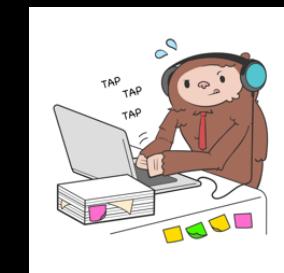

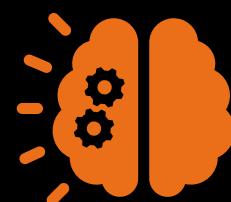

Definite &  
Unambiguous

# Algorithm vs Program

	Algorithm	Code or Program
<b>Focus of a professional</b>		
<b>Form</b>		
<b>Dependence on H/W or OS</b>		
<b>Professional's Cognitive State</b>		
<b>Correctness/Performance</b>		

# Algorithm vs Program

	Algorithm	Code or Program
<b>Focus of a professional</b>	Design	Implementation
<b>Form</b>	Pseudocode	Programming Language
<b>Dependence on H/W or OS</b>	No	Yes
<b>Professional's Cognitive State</b>	Thinking	Doing
<b>Correctness/Performance</b>	Analysis	Testing

# Multiple Ways of Solving a Problem

# Multiple Ways of Solving a Problem

Problem: Determine if a sorted array contains any duplicates.

-13	-11	12	14	24	24	100	102
-----	-----	----	----	----	----	-----	-----

# Multiple Ways of Solving a Problem

Objective: Determine if a sorted array contains any duplicates.

-13	-11	12	14	24	24	100	102
-----	-----	----	----	----	----	-----	-----

Silly algorithm: Every possible pair

# Multiple Ways of Solving a Problem

Objective: Determine if a sorted array contains any duplicates.

-13	-11	12	14	24	24	100	102
-----	-----	----	----	----	----	-----	-----

Silly algorithm: Every possible pair

Better algorithm: Compare adjacents

# Multiple Ways of Solving a Problem

Objective: Determine if a sorted array contains any duplicates.

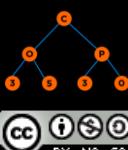

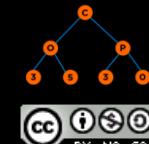

-13	-11	12	14	24	24	100	102
-----	-----	----	----	----	----	-----	-----

Silly algorithm: Every possible pair

Better algorithm: Compare adjacents

**Now that we know, that there are multiple ways to solve a problem,  
how do we evaluate which one is better?**

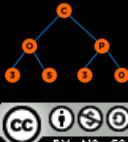

Are all  
programs/algorithms  
equal in terms of  
performance?

# Performance

In terms of what?

Are all programs/algorithms equal in terms of performance?

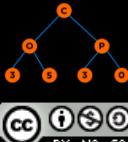

# Performance

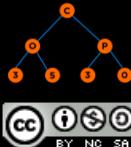

In terms of what?

- Time
- Space

Are all programs/algorithms equal in terms of performance?

# Why do we care about algorithms?

# Why do we care about algorithms?

- **Knowing**

- **Experiencing**

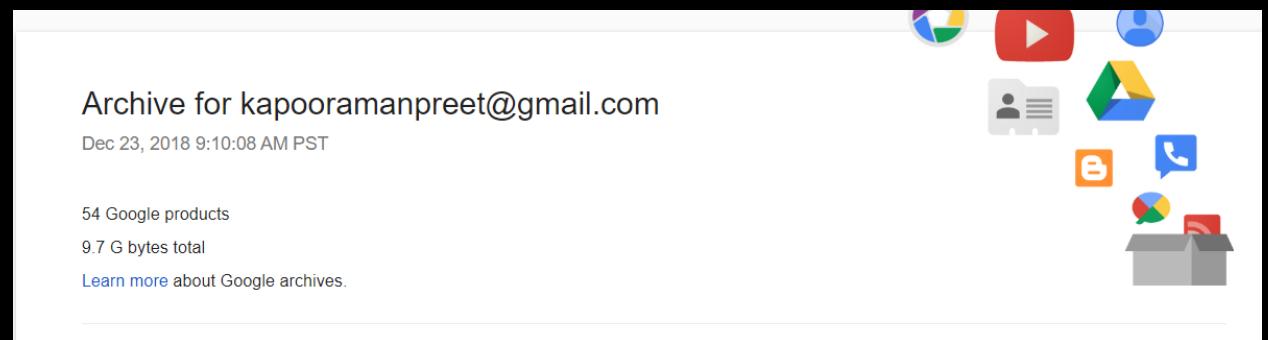

- **Selling**

- **Cost**

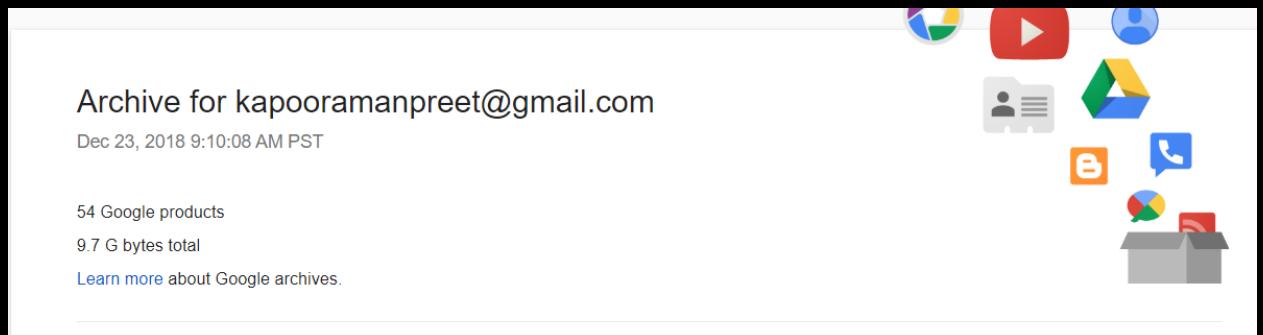

# A Simple Example

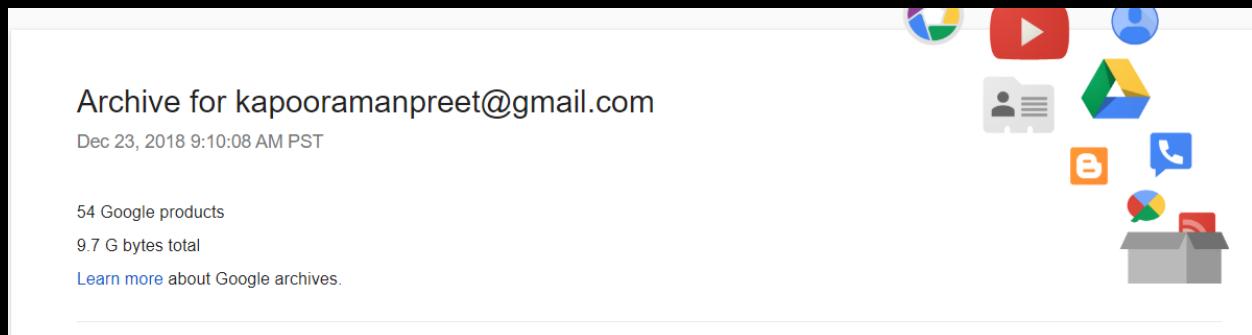

# A Simple Example

- **Google has 2 billion active users**
  - **Conservative estimate ~ 1 GB of data/user**
  - **Total Data (Space):**

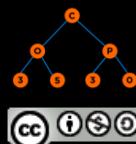

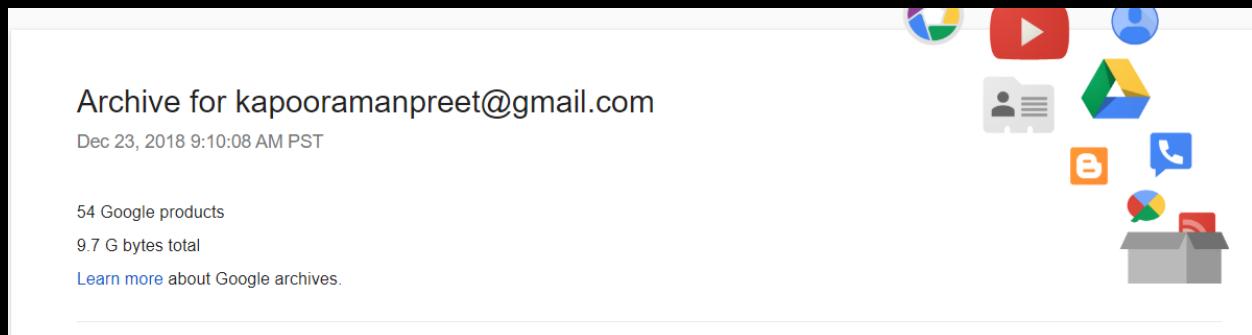

# A Simple Example

- **Google has 2 billion active users**
  - **Conservative estimate ~ 1 GB of data/user**
  - **Total Data (Space): 2 Exabytes**
  - **Total Time:**

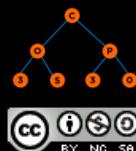

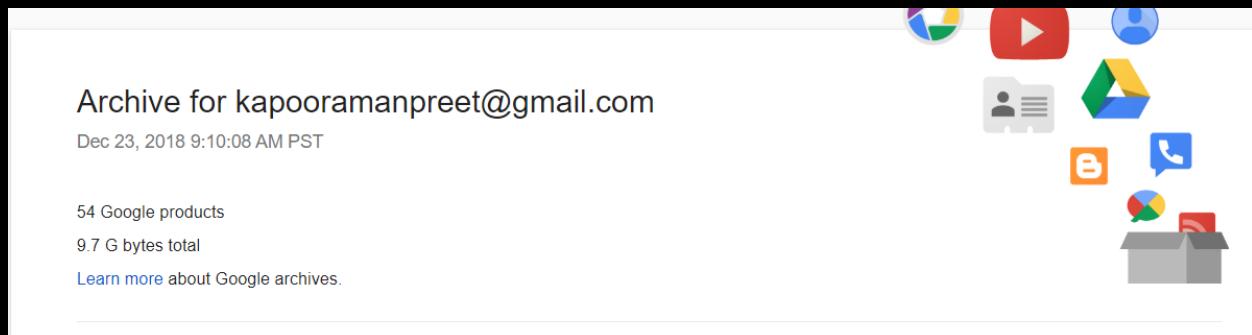

# A Simple Example

- **Google has 2 billion active users**
  - **Conservative estimate ~ 1 GB of data/user**
  - **Total Data (Space): 2 Exabytes**
  - **Total Time:**
    - **Operation Speed: 0.5 ns**
    - **Linear Search**
    - **Binary Search**

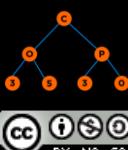

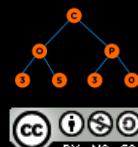

# A Simple Example

- **Google has 2 billion active users**
  - **Conservative estimate ~ 1 GB of data/user**
  - **Total Data (Space): 2 Exabytes**
  - **Total Time:**
    - **Operation Speed: 0.5 ns**
    - **Linear Search: 11574 days or 31 years**
    - **Binary Search: 31s**

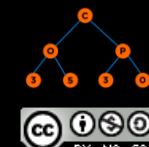

In short, we care about performance ...

So, how do we measure performance?

# Questions to ask when evaluating programs

- **Time: How much time does this take?**
- **Space: How much space does this consume?**
- **Data: Are there any patterns in our data?**

# Approach 1 (Simulation: Timing)

# Approach 1 (Simulation: Timing)

**Code #1**

```
01 auto t1 = Clock::now();  
02 for(int i=0; i<1000; i++);  
03 auto t2 = Clock::now();  
04 Print t2-t1
```

**Code #2**

```
01 auto t1 = Clock::now();  
02 for(int i=0; i<1000000; i++);  
03 auto t2 = Clock::now();  
04 Print t2-t1
```

# Approach 1 (Simulation: Timing)

**Code #1**

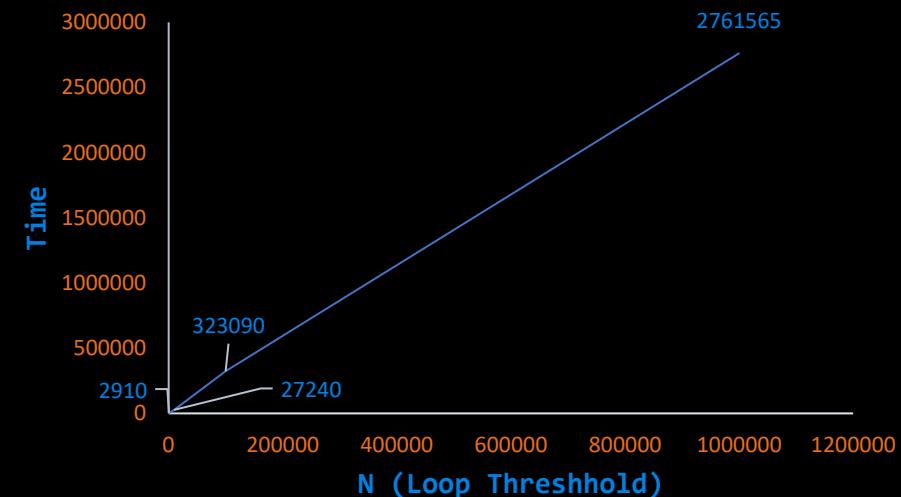

```
01 auto t1 = Clock::now();
02 for(int i=0; i<1000; i++);
03 auto t2 = Clock::now();
04 Print t2-t1
```

**Code #2**

```
01 auto t1 = Clock::now();
02 for(int i=0; i<1000000; i++);
03 auto t2 = Clock::now();
04 Print t2-t1
```

**Output**

```
Delta t = t2-t1 (1000): 2910 nanoseconds
Delta t = t2-t1 (10000): 27240 nanoseconds
Delta t = t2-t1 (100000): 323090 nanoseconds
Delta t = t2-t1 (1000000): 2761565 nanoseconds
```

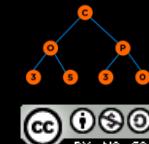

<https://onlinegdb.com/BJGAP7I5I>

# Approach 1 (Simulation: Timing)

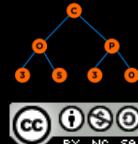

Pros	Cons

# Approach 1 (Simulation: Timing)

Pros	Cons
Easy to measure	Results vary across machines
Easy to interpret	Compiler dependent
	Results vary across implementations
	Not predictable for small inputs
	No clear relationship between input and time

# Approach 2 (Modeling: Counting)

# Approach 2 (Modeling: Counting)

Count the number of operations

# Approach 2 (Modeling: Counting)

Count the number of operations

```
01 int sum=0;  
02 for(int i=0; i<n; i++)  
03     sum += i;  
04 print sum
```

Operation	Symbolic count
int sum=0;	
int i=0;	
i<n;	
i++	
sum += i;	
print sum	
T(n)	

# Approach 2 (Modeling: Counting)

Count the number of operations

```
01 int sum=0;  
02 for(int i=0; i<n; i++)  
03     sum += i;  
04 print sum
```

Operation	Symbolic count
int sum=0;	1
int i=0;	1
i<n;	0...n = n+1
i++	n
sum += i;	n
print sum	1
T(n)	3n+4

# Approach 2 (Modeling: Counting)

Pros	Cons

# Approach 2 (Modeling: Counting)

Pros	Cons
Independent of computer	All operations are equal
Input dependence is captured in model (Scaling)	Tedious to compute
	Results vary across implementations
	Doesn't tell you actual time

# Approach 2 (Modeling: Counting)

## Count the number of operations

```
01 int sum=0;  
02 for(int i=0; i<n; i++)  
03     sum += i;  
04 print sum
```

Tedious to compute:

Different variables, so many operations, so many equations!

Operation	Symbolic count
int sum=0;	1
int i=0;	1
i<n;	0...n = n+1
i++	n
sum += i;	n
print sum	1
$T(n)$	$3n+4$

# Approach 2 (Modeling: Counting)

## Count the number of operations

```
01 int sum=0;  
02 for(int i=0; i<n; i++)  
03     sum += i;  
04 print sum
```

Tedious to compute:

Different variables, so many operations, so many equations!

Operation	Symbolic count
int sum=0;	1
int i=0;	1
i<n;	0...n = n+1
i++	n
sum += i;	n
print sum	1
$T(n)$	$3n+4$

Can we eliminate the complexity or get rid of extraneous variables?

# Approach 3 (Asymptotic Behavior: Order of Growth)

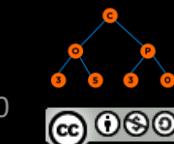

# Which variables should we eliminate?

Operation	Symbolic count
int sum=0;	1
int i=0;	1
i<n;	$0 \dots n = n+1$
i++	n
sum += i;	n
print sum	1
T(n)	$3n+4$

# Growth of Functions

Time,  $y = T(n)$

Order of Growth gets Faster or Functions rise faster

# Eliminate functions that grow slower

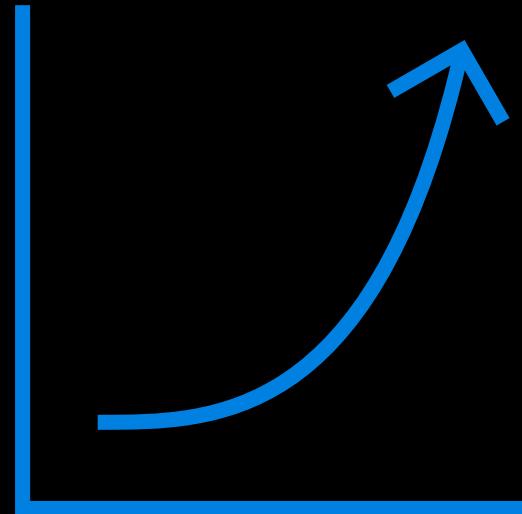

# Approach 3 (Asymptotic Behavior: Order of Growth)

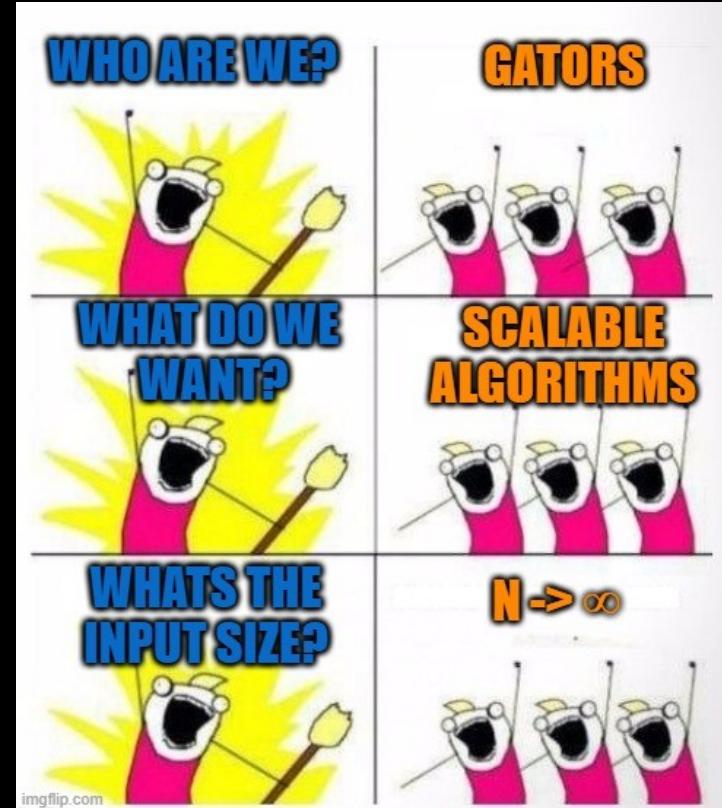

Very Large N

# Approach 3 (Asymptotic Behavior: Order of Growth)

Very Large N

<https://imgflip.com/i/3z0jdf>

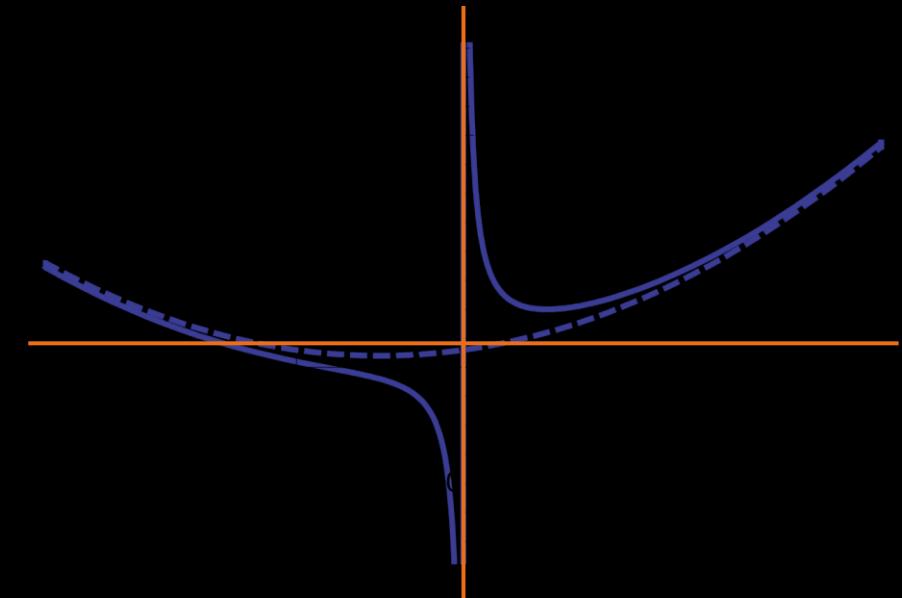

# Notations for Algorithm Complexity

**Time - Number of Operations:**

- **Big-O** : Upper Bound
- **Big- $\Omega$**  : Lower Bound
- **Big- $\Theta$**  : Upper + Lower Bound

# Asymptotic Bounding

- Line that approaches a curve but never meets
- Analysis of tail behavior
- $N \rightarrow \text{Infinity}$

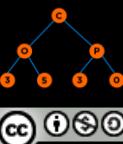

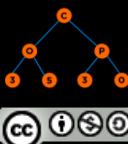

[This Photo](#) by Unknown Author is licensed under [CC BY-SA](#)

# Big O (Visualize)

$T(n) \in O(f(n))$

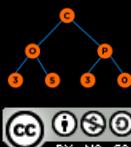

- If there exists two positive constants,  $n_0$  and  $c$ , such that  $T(n) \leq c.f(n)$  for all  $n \geq n_0$
- $f(n)$  is an upper bound on performance
- $T(n)$  will grow no faster than constant times  $f(n)$
- Use tighter upper bound

# Big Ω

$T(n) \in \Omega(g(n))$

- If there exists two positive constants,  $n_0$  and  $c$ , such that  $T(n) \geq c.g(n)$  for all  $n \geq n_0$
- $g(n)$  is a lower bound on growth rate of  $T(n)$
- $T(n)$  will grow no slower than constant times  $g(n)$
- Use tighter lower bound

# Big Θ

$T(n) \in \Theta(g(n))$

- If  $T(n) = O(g(n))$  and  $T(n) = \Omega(g(n))$
- $c_1 \cdot g(n) \leq T(n) \leq c_2 \cdot g(n)$  for all  $n \geq n_0$
- **$g(n)$  is a tight upper and lower bound on the growth rate of  $T(n)$**

# Big Θ vs Big O vs Big Ω

	Informal meaning:	Family	Family Members, T(n)
<b>Big Theta</b> $\Theta(f(N))$	<b>Order of growth is f(N).</b>	$\Theta(N^2)$	$N^2/12$ $2N^2$ $N^2 + 11N$
<b>Big O</b> $O(f(N))$	<b>Order of growth is less than or equal to f(N).</b>	$O(N^2)$	$N^2/2$ $N^2 + 1$ $lg(N)$
<b>Big Ω</b> $\Omega(f(N))$

# Constant Growth Rate, O(1)

If processing time is independent of the number of inputs n, the algorithm grows at a constant rate

```
01 int sum(int n)
02 {
03     int sum = 0;
04     sum += n;
05     return sum;
06 }
07 }
```

n	y = f(c)
1	3
10	3
100	3
1000	3
10000	3
100000	3
1000000	3
10000000	3
100000000	3

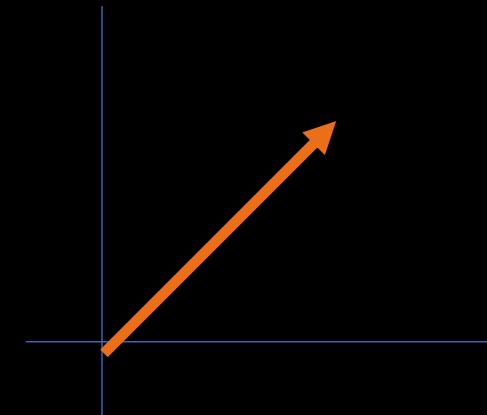

$$T(n) = 3, T(n) \in O(1)$$

# Linear Growth Rate

If processing time increases in proportion to the number of inputs n, the algorithm grows at a linear rate

```
01 int sum(int n)
02 {
03     int sum = 0;
04     for (int i=0; i<n; i++)
05         sum += i+1;
06     return sum;
07 }
```

n	y = f(n)
1	1
10	10
100	100
1000	1000
10000	10000
100000	100000
1000000	1000000
10000000	10000000
100000000	100000000

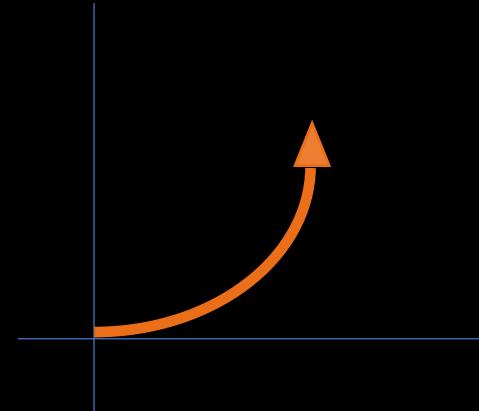

$$T(n) = 3n + 4, T(n) \in O(n), c=4, n_0>4$$

# Quadratic Growth Rate

If processing time increases in proportion to the square of input size  $n$ , the algorithm grows at a quadratic rate

```
01 bool find(int n[][], int t)
02 {
03     int i, j;
04     for(i=0; i < n.size; i++)
05         for(j=0; j < n.size; j++)
06             if (x[i][j] == t)
07                 return true;
08     return false;
09 }
```

$n$	$y = f(n^2)$
1	1
10	100
100	10000
1000	1000000
10000	100000000
100000	10000000000
1000000	1E+12
10000000	1E+14
100000000	1E+16

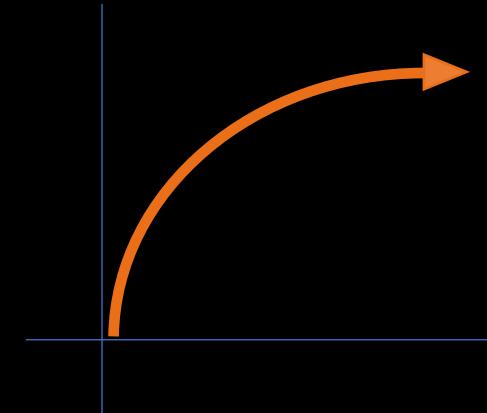

$$T(n) = n^2 + 3n + 5, T(n) \in O(n^2), c=? , n_0 > ?$$

# Logarithmic Growth Rate

If processing time increases in proportion to the  $\log n$ ,  
the algorithm grows at a logarithmic rate

```
01 int sum(int n)
02 {
03     int sum = 0;
04     for (int i=1; i<=n; i*=2)
05         sum += i;
06     return sum;
07 }
```

n	y = f( $\log_2 n$ )
1	0
10	3
100	7
1000	10
10000	13
100000	17
1000000	20
10000000	23
100000000	27

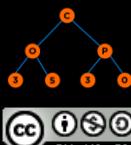

# Different Growth Rates

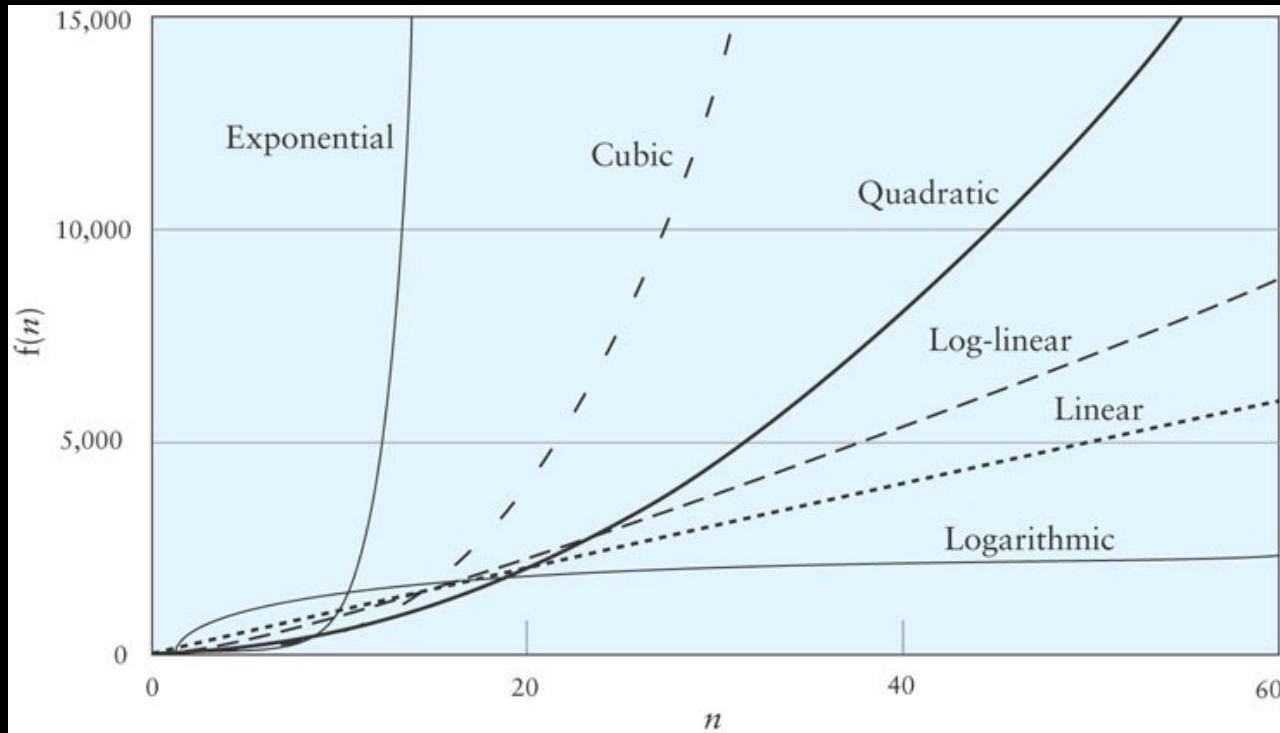

Inputs: n	Time

# Tips for Asymptotic Analysis (Big O)

# Tip #1: Addition (Independence)

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<m; j++)
07         cout<<j;
08 }
09
```

# Tip #1: Addition (Independence)

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<m; j++)
07         cout<<j;
08 }
09
```

$$T(n, m) = O(n+m)$$

# Tip #2: Drop Constant Multipliers

```
01 void func1(int n)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<n; j++)
07         cout<<j;
08 }
09
```

# Tip #2: Drop Constant Multipliers

```
01 void func1(int n)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<n; j++)
07         cout<<j;
08 }
09
```

$$T(n) = O(n+n) = O(2n)$$
$$\sim O(n)$$

# Tip #3: Different Input Variables

```
01 void func1(int n, int l)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<l; j++)
07         cout<<j;
08 }
09
```

# Tip #3: Different Input Variables

```
01 void func1(int n, int l)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=0; j<l; j++)
07         cout<<j;
08 }
09
```

$$T(n, l) = O(n+l)$$

**Describe what the variable is, Always!**

**Example:  $O(s)$  where  $s$  is the size or length of a string**

# Tip #4a: Drop Lower Order Terms with Similar Growth Rates

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=1; j<=n; j*=2)
07         cout<<j;
08 }
09
```

# Tip #4a: Drop Lower Order Terms with Similar Growth Rates

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=1; j<=n; j*=2)
07         cout<<j;
08 }
09
```

$$T(n) = O(n + \log_2 n)$$
$$\sim O(n)^*$$

\*Both variables are  $n$  and grow at the same rate.

# Tip #4b: Drop Lower Order Terms with Similar Growth Rates

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=1; j<=m; j*=2)
07         cout<<j;
08 }
09
```

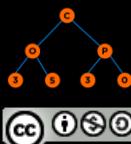

# Tip #4b: Drop Lower Order Terms with Similar Growth Rates

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=1; j<=m; j*=2)
07         cout<<j;
08 }
09
```

$$T(n, m) = O(n + \log_2 m)$$
$$\sim O(n)^*$$

\*Assuming  $n$  and  $m$  are growing at the same rate.

If you are given in the question that  $n$  and  $m$  are growing at the same rate or if you assume they are growing at the same rate, then simplifying is fine

# Tip #4c: Do not drop Lower Order Terms with different Growth Rates

```
01 void func1(int n, int m)
02 {
03     for (int i=0; i<n; i++)
04         cout<<i;
05
06     for (int j=1; j<=m; j*=2)
07         cout<<j;
08 }
09
```

$$T(n, m) = O(n + \log_2 m)^*$$

\*Assuming no relationship is given between  $n$  and  $m$ .

# Mentimeter

**Menti.com

# Mentimeter

An algorithm's total run time is given by the expression,  
 $T(n, p) = 10n + p$ . What is the representation of this  
program's execution time in Big O?

$O(n+p)$

# Mentimeter

```
for (int i = 100; i > -1; i--)  
    for (int j = i; j > 1; j/=2)  
        print("viola")
```

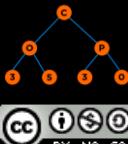

0(1)

# Logarithmic growth

```
for(i = 1; i <= n; i *= 2)
```

```
for(i = n; i >= 1; i /= 2)
```

[https://en.wikipedia.org/wiki/1\\_%2B\\_2\\_%2B\\_3\\_%2B\\_4\\_%2B\\_%E2%8B%AF](https://en.wikipedia.org/wiki/1_%2B_2_%2B_3_%2B_4_%2B_%E2%8B%AF)  
[https://en.wikipedia.org/wiki/1\\_%2B\\_2\\_%2B\\_4\\_%2B\\_8\\_%2B\\_%E2%8B%AF](https://en.wikipedia.org/wiki/1_%2B_2_%2B_4_%2B_8_%2B_%E2%8B%AF)  
[https://en.wikipedia.org/wiki/1/2\\_%2B\\_1/4\\_%2B\\_1/8\\_%2B\\_1/16\\_%2B\\_%E2%8B%AF](https://en.wikipedia.org/wiki/1/2_%2B_1/4_%2B_1/8_%2B_1/16_%2B_%E2%8B%AF)

# Mentimeter

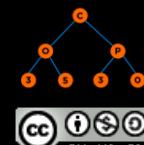

```
for(int i = n; i > 0; i /= 2)
    for(int j = 1; j < i; j++)
        sum += 1;
```

$O(n)$

# Mentimeter

```
// This is A  
for(int i=1; i<n; i*=2);  
  
// This is B  
for(int i=1; i<n; i*=3);
```

They both take same time in terms of Big O

# Mentimeter

```
// This is A  
for(int i=1; i<n; i*=2);  
  
// This is B  
for(int i=1; i<n; i*=3);
```

B will be faster in terms of execution time/simulation

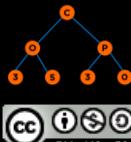

# Enter Data

Best Case	Average Case	Worst Case
Lowest cost	Average cost for all n	Highest cost

# Enter Data

Best Case	Average Case	Worst Case
Lowest cost	Average cost for all n	Highest cost

- **Average/Best/Worst case measure actual costs at a specific input instance.**
- **You can define a specific order of instance but cannot propose variability in input size.**
  - In general, calculating best case time complexity under the assumption that the data structure has a small size, example: when an array has size 1 or the tree is empty should be avoided. The complexity is calculated without thinking about the size of input. But it is perfectly fine to think about the properties of input or data structure such as data is sorted, height will always be proportional to  $\log n$  for a balanced tree, etc.
  - Asymptotic analysis assumes  $n$  is very large. Whether it be big O, theta, or omega, it always refers to the case of very large  $n$ . The best / average / worst cases arise in different structural cases, exclusive of size.
- **Growth Rate measures change in costs.**

```

$O(\text{size} \cdot t)$ , where  $\text{size}$  is size of array,  $t$  is size of target string,  $s$  is the max length of all strings in the array, and we are assuming that  $t$  and  $s$  grow at same rates.

<https://onlinegdb.com/opeGj9PmNm>

# Linear Search: Assuming a large array

```
1. #include <iostream>
2. #include <string>
3.
4. std::string linearSearch(const std::string arr[], int size, std::string t)
5. {
6.     for(int i = 0; i < size; i++)
7.     {
8.         if(arr[i].compare(t) == 0)
9.             return std::string("found at index = ") + std::to_string(i);
10.    }
11. }
12.
13. int main()
14. {
15.     std::string arr[] = {"hello", "world", "cop3530", "cop3502", ...};
16.     std::string target = "curious";
17.     int size = sizeof(arr) / sizeof(arr[0]);
18.     std::cout << (linearSearch(arr, size, target));
19. }
```

$O(\text{size} \cdot t)$ , where  $\text{size}$  is size of array,  $t$  is size of target string,  $s$  is the max length of all strings in the array, and we are assuming that  $t$  and  $s$  grow at same rates.

## Clarification:

This program will yield an equation,

$$T(\text{size}, t) = (\text{size} * \min(t, s)) + X_c$$

This function  $T(\text{size}, t)$  will be an element of  $O(\text{size} \cdot t)$ ,  $O(\text{size} \cdot t \cdot t)$ ,  $O(\text{size} \cdot \text{size} \cdot t)$ , ... and several other functions.

When we talk about **Big O**, we want a measure to describe the **upper bound**. For the sake of the course, we seek the **tightest upper bound**.

# Linear Search: Assuming a large array

```
1. #include <iostream>
2. #include <string>
3.
4.     std::string linearSearch(const std::string arr[], int size, std::string t)
5.     {
6.         for(int i = 0; i < size; i++)
7.         {
8.             if(arr[i].compare(t) == 0)
9.                 return std::string("found at index = ") + std::to_string(i);
10.            }
11.        return std::string("not found");
12.    }
13.
14.    int main()
15.    {
16.        std::string arr[] = {"hello", "world", "cop3530", "cop3502", ...};
17.        std::string target = "curious";
18.        int size = sizeof(arr) / sizeof(arr[0]);
19.        std::cout << (linearSearch(arr, size, target));
20.        return 0;
21.    }
```

$O(\text{size} \cdot t)$ , where  $\text{size}$  is size of array,  $t$  is size of target string,  $s$  is the max length of all strings in the array, and we are assuming that  $t$  and  $s$  grow at same rates.

## Clarification:

This program will yield an equation,

$$T(\text{size}, t) = (\text{size} * \min(t, s)) + X_c$$

This function  $T(\text{size}, t)$  will be an element of  $\Omega(\text{size} \cdot t)$ ,  $\Omega(\text{size})$ ,  $\Omega(t)$ ,  $\Omega(1)$  ... and several other functions.

When we talk about Big  $\Omega$ , we want a measure to describe the lower bound. For the sake of the course, we seek the tightest lower bound.

# Linear Search: Assuming a large array

```
1. #include <iostream>
2. #include <string>
3.
4.     std::string linearSearch(const std::string arr[], int size, std::string t)
5.     {
6.         for(int i = 0; i < size; i++)
7.         {
8.             if(arr[i].compare(t) == 0)
9.                 return std::string("found at index = ") + std::to_string(i);
10.            }
11.        return std::string("not found");
12.    }
13.
14.    int main()
15.    {
16.        std::string arr[] = {"hello", "world", "cop3530", "cop3502", ...};
17.        std::string target = "curious";
18.        int size = sizeof(arr) / sizeof(arr[0]);
19.        std::cout << (linearSearch(arr, size, target));
20.        return 0;
21.    }
```

$O(\text{size} \cdot t)$ , where size is size of array, t is size of target string, s is the max length of all strings in the array, and we are assuming that t and s grow at same rates.

## Clarification:

This program will yield an equation,

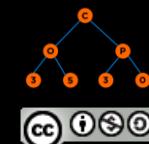

$$T(\text{size}, t) = (\text{size} * \min(t, s)) + X_c$$

In this program, the time complexity of the code is

- $O(\text{size} \cdot t)$
- $\Omega(\text{size} \cdot t)$
- $\Theta(\text{size} \cdot t)$

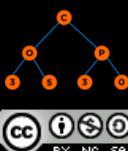

# Peak Finding

- **Input:**
  - You are given an array of numbers
  - The data is randomly sorted
- **Output:**
  - A Peak value
  - Peak is a number such that it is greater than or equal to both of its adjacent elements
  - In case of the boundary values, a peak must be greater than or equal to the one adjacent element.
